

In regard to your RM-10209, I was a missionary for 28 years in the Peruvian Amazon. We used the assigned frequency of 5.370 MHz for our local missionary radio network. We used transcievers with 20 watt output power. Communications were excellent from 6 am till 6 pm. We were unable to communicate from sundown till sunrise. Our area of coverage was approximately a radius of about 300 miles. Perhaps you can use this information in considering a 60 meter band for ham radio. I have been a ham for 49 years and am presently licensed Extra class WD4CRB. My Peruvian ham license was OA8B. Thank you.
